

Postdoctoral Fellow or Research Assistant Position

A funded position is available for a Postdoctoral Fellow or experienced Research Assistant to study the regulation of heterotrimeric G protein signaling function and subcellular trafficking. The position will focus on the role of mutationally activated G protein subunits in uveal melanoma cell lines. The position will use a variety of molecular and cell biology techniques, including mutagenesis, gene editing, developing novel signaling assays, fluorescence microscopy, and cell culture. A strong background in molecular biology, cell biology and genomics is required. E-mail CV and names of three references to:
